

Q-300XT

Success Story

"Is the process now faster? Without question. We used to bottleneck real bad at the stretch wrapping machine. The only bottleneck now is getting trucks in the loading dock fast enough." --Greg Gilbert, Shipping Manager, Rev-A-Shelf, Inc.

Problem

Having one employee handle pallet preparation in one location and stretch wrapping in another meant forklift operators were not able to keep a continuous work flow.

Solution

The Q-300XT, with its lanyard switch, allows forklift operators themselves to initiate and complete the wrap cycle from behind the wheel, eliminating the feast-or-famine bottleneck.

Benefits

- Eliminates need for separate stretch wrap operator
- Keeps operator on forklift
- Lower film costs
- Easy to use

A Powerful Difference

Most customers wrapping between 30-100 loads per day find that the Q-300XT improves their overall productivity.

The Q-300XT Stretch Wrapping System from Lantech was the answer. With banding now being handled by those performing order-pick duties, the forklift operators immediately handle the rest of the process themselves.

The Q-300XT automatically attaches and cuts the film, eliminating the need for a separate operator and the wait that had been involved. Rev-A-Shelf found several features of the Q-300XT to be ideal for their situation: Easy-to-use controls, Lantech's E-Z Thread® film roll carriage, and the Q-300XT's "Simple Automation™."
