

## S-1500 with Pallet-Grip™

### Success Story

"When Home Depot, our largest customer, said they would start rejecting our asphalt sealer if loads were not wrapped to the pallet, it got our attention."

--Production Supervisor, asphalt sealer manufacturer

#### Problem

Severely offset loads consisting of 5-gallon pails have to be wrapped to the pallet to satisfy Home Depot's requirement for damage reduction.

#### Solution

The S-1500 automatic stretch wrapper - equipped with optional Pallet-Grip - spins a high-strength cable of film on the bottom edge of the web, and then tensions it around the top edge of the pallet.

#### Benefits

- Meets latest requirements from big-box retailers
- Best system in the industry for locking load to pallet
- Ideal for double-stacked or winged pallets
- Perfect for pails, barrels, or rolls on pallets
- Eliminates need for costly load lift
- Less expensive than a roper

### A Powerful Difference

*Even severely offset loads don't shift with Pallet-Grip. Lantech overhead automatic stretch wrappers are the only ones in the world that can wrap the bottom of the pallet without a costly load lift and roper.*

It's a classic round peg in a square hole: 5-gallon pails of asphalt sealer on a pallet are a real challenge for containment when your customer demands your loads be wrapped to the pallet. But Pallet-Grip takes offset loads and winged pallets in stride. The Pallet-Grip system rolls the lower edge of the bottom film wrap into a strong cable, then stretches it around the top of the pallet base. The bottom film wraps - even if they sometimes tear at the corners - maintain excellent containment. This is more than roping. The Pallet-Grip cable behaves like a wire reinforcement built into the bottom edge of the film web. It keeps load wired tight. And fork trucks can't break the hold of Pallet-Grip, because the film web stays above the through-holes.
